Description

When using a super-/subquery combination as an if-then construct, I want to hide the content of the super-query but show the result of sub-queries. At the moment this is not possible with the content-keyword. It would be nice to have the option to not hide the subqueries.

Personally I would think it most logical to make this the default for hide and use e.g. hide_all to include subqueries. For backwards compatibility however, the new behaviour should probably get the new keyword. I suggest something like hide_this
